³*Dept. of Botany, PG College of Science, Osmania University, Saifabad, Hyderabad - 500004*

Various soils viz. pond mud soil, forest soils, cultivated soils supporting different crop plants and rhizosphere soils of some crop plants from Andhra Pradesh were surveyed during 1964-2011 for microfungi. Altogether 348 fungal species have been isolated, identified and deposited. The data indicates that there is a hidden wealth of fungi in soil habitat. Among the fungi isolated hyphomycetous fungi have dominated the soils. Members of Basidiomycotina, Mastigomycotina (zoosporic fungi) and Zygomycotina were less frequent. Amongst the genera *Aspergillus* (38 species) and *Penicillium* (35 species) were predominant followed by *Chaetomium* (26 species) and *Trichoderma* (18 species).

Keywords: Fungi, forest soil, rhizosphere soil, species.

Soil being a complex ecosystem, is composed of multiple micro habitats and harbours almost all major taxonomic groups of fungi. Along with bacteria, actinomycetes and algae, fungi are primary decomposers; agents of biogeochemical transformation and recyclers of stored energy and nutrients of the organic matter already degraded by invertebrates and other microbes for plant growth. Moreover, the intrusive apical growth habit of fungi allows them to access efficiently the organic substrates; hence they play a major role as recyclers of biosphere. Even though the chemical composition of soil influences its fertility, it is greatly influenced by the qualitative and quantitative nature of microbes inhabiting it. Being natural scavengers, without them we would be surrounded by piles of detritus and dead plant matter. At one stage or the other all the geofungi are involved in the complex food chain through their interactions with soil fauna and other microbes: as food for various nematodes, mites, collembolans, and as parasites and predators of these and other soil fauna and microbes; as recyclers of waste products and other chemicals secreted and excreted by plant roots, animals and microbes; and as transformers and biodegraders of xenobiotics.

Most of the studies on soil fungi deal with quantification of fungi. Relatively few compilations of descriptions are available on geofungi or soilfungi (Gilman 1957, Domsch *et al.* 1980, 1993; Ramarao and Manoharachary 1990, Davet and Rouxel 2000, Watanabe 2002, Nagamani *et al.* 2006). Besides these the descriptive accounts of fungi isolated from various soils and other sources were included in monographs and

manuals by Raper and Thom (1949), Raper and Fennell (1965), Barron (1968), Ellis (1971, 1976), Subramanian (1971), Ainsworth *et al.* (1973), Barnett and Hunter (1998), Pitt (1979), Carmichael *et al.* (1980), Sutton (1980) and Arx (1980). Approximately 450 species are listed in the "Compendium of Soil Fungi" (Domsch *et al.* 1980). Barron (1968), Domsch and Gams (1972) and Domsch *et al.* (1980) have described soil fungi from temperate soils. The concepts of biodiversity, inventory and monitoring methods of saprobic soil fungi have been discussed by Bills *et al.* (2004).

The fungi that are reported from time to time from India from all the sources have been listed in various indexing books (Butler and Bisby 1960, Tilak and Rao 1968, Rangaswamy *et al.* 1970, Kamat *et al.* 1971, Tandon and Sudhir Chandra 1973, Mukerji and Juneja 1976, Bilgrami *et al.* 1979, 1981, 1991, Sarbhoy *et al.* 1975, 1980, 1986, 1996 and Jamaluddin *et al.* 2004). Soil fungi have been reported from Andhra Pradesh by Rao (1962, 1965) Manoharachary (1974, 1975, 1976a,b), Manoharachary and Bilolikar (1979), Manoharachary and Ramarao (1974a,b, 1975, 1978), Manoharachary and Reddy (1975), Manoharachary *et al.* (1975a,b, 1989), Madhusudan Rao and Manoharachary (1981), Khalis (1985), Ramarao (1962), Reddy and Manoharachary (1977), Vaidehi (1973) and Venugopal Rao *et al.* (1984). However, there is no consolidated account of these fungi associated with different soils. Therefore an attempt is made to provide the data on soil fungi from Andhra Pradesh, India.

MATERIALS AND METHODS

Topography and Climate of study area

Andhra Pradesh is one of the 28 states of India, situated on the country's southeastern coast (Fig. 1). It is India's fourth largest state by area and fifth largest by population. Its capital and largest city is Hyderabad. Andhra Pradesh lies between $12^{\circ}41'$ and $22^{\circ}N$ latitude and 77° and $84^{\circ}40'E$ longitude, and is bordered by Maharashtra, Chhattisgarh and Orissa in the north, the Bay of Bengal in the east, Tamil Nadu to the south and Karnataka to the west.

Geographically, Andhra Pradesh is composed of most of the eastern half of the Deccan plateau and the plains to the east of the Eastern Ghats. Andhra

Pradesh is divided into three regions. The northern part of the plateau is the Telangana region and the southern part is known as Rayalaseema. These two regions are separated by the River Krishna. The third region is Coastal Andhra. The plains to the east of Eastern Ghats form the Eastern coastal plains. The Eastern Ghats are discontinuous and individual sections have local names. The Eastern Ghat region is home to dense tropical forests, while the vegetation becomes sparse as the Ghats give way to the Deccan Plateau, where shrub vegetation is more common. Most of the coastal plains are put to intense agricultural use. The west and southwest parts of Andhra Pradesh have semi-arid conditions.

The climate of Andhra Pradesh varies considerably, depending on the geographical region. Monsoons play a major role in determining the climate of the

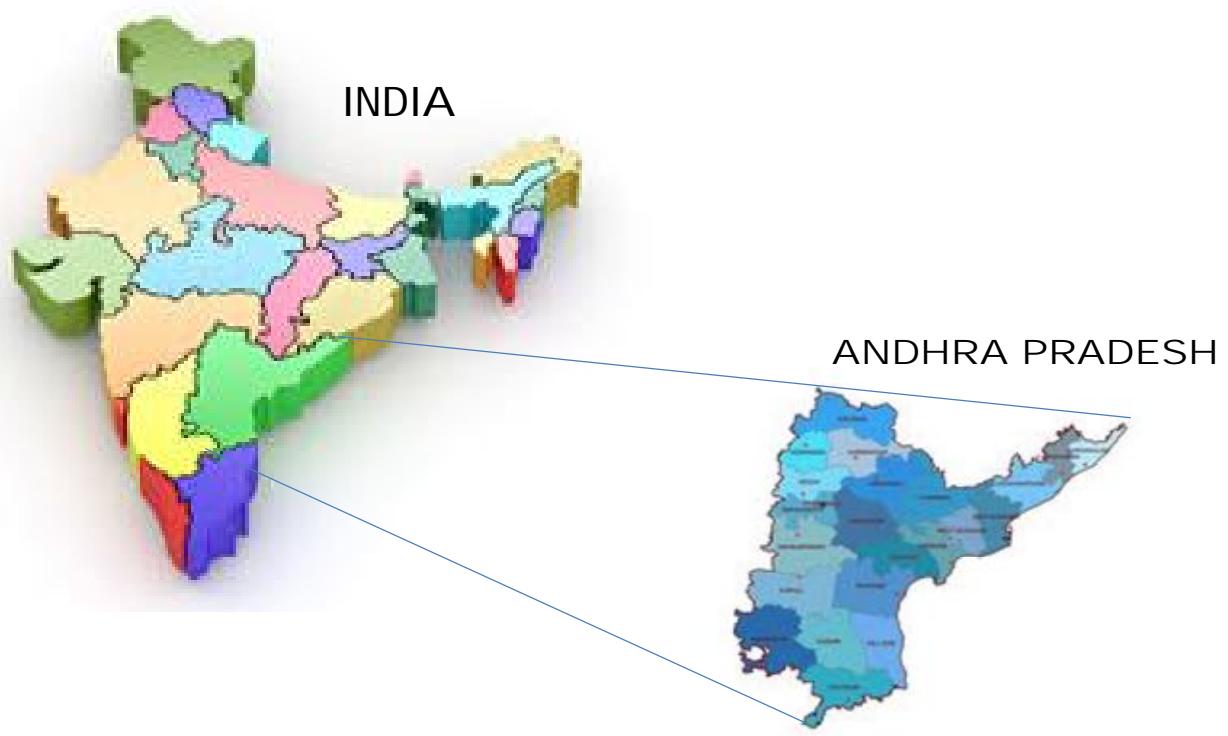

Figure1: Area Map of Fungal Samples Collected from Andhra Pradesh, India

state. Summers last from March to June. In the coastal plain, the summer temperatures are generally higher than the rest of the state, with temperature ranging between 20 °C and 41 °C. At certain places the temperature reaches as high as 45 degrees on a summer day. July to September is the seasons for tropical rains in Andhra Pradesh. The state receives heavy rainfall from Southwest Monsoon during these months. About one third of the total rainfall in Andhra Pradesh is brought by the Northeast Monsoon. October and November see low-pressure systems and tropical cyclones form in the Bay of Bengal which, along with the Northeast Monsoon, bring rains to the southern and coastal regions of the state. November, December, January, and February are the winter months in Andhra Pradesh. Since the state has a long coastal belt the winters are not very cold. The range of winter temperature is generally 12 °C to 30 °C.

Sample collection

Soil samples were collected (1-6 cm depth) with a surface sterilized (95% alcohol) trowel after scraping away an inch of surface soil into fresh polythene bags or sterile vials. In case of mud samples the marginal mud samples were taken with a sterilized spoon into fresh polythene bags. Around 8-10 samples were collected from soil/mud at random and made into a composite mixture. The collected samples were kept at a cool place under aseptic conditions and transported to the laboratory for assessment of soil fungi. The stones and debris were removed before the isolation. To get uniform results, ten replicate plates were prepared for each sample. Total number of samples collected from different parts of Andhra Pradesh being 390.

Isolation of fungi

The fungi from soils were isolated by employing Dilution plate method (Waksman 1916), Soil plate method (Warcup 1950), Immersion tube and immersion slide method (Chesters 1948), and Warcup's (1955) fungal hyphae isolation from soil. All these methods were employed in order to get a comprehensive representation of soil fungi. Potato Dextrose Agar (PDA) medium was used to isolate all the fungi. Czapak's Dox Agar medium was used to study *Aspergillus* and *Penicillium* species. Oat Meal Agar Medium or Pentachloronitrobenzene (PCNB) Agar medium was employed for growing species of *Pythium* and others, 2% water Agar has been used to isolate species of *Fusarium*. Cultures were maintained on PDA at 10°C in the refrigerator besides maintaining them in mineral oil and silica gel.

Aspergillus and *Penicillium* species. Oat Meal Agar Medium or Pentachloronitrobenzene (PCNB) Agar medium was employed for growing species of *Pythium* and others, 2% water Agar has been used to isolate species of *Fusarium*. Cultures were maintained on PDA at 10°C in the refrigerator besides maintaining them in mineral oil and silica gel.

Identification of fungi

The isolated fungi have been identified up to species level using the keys provided by Raper and Thom (1949), Gilman (1957), Raper and Fennell (1961), Barron (1968), Subramanian (1971), Ellis (1971,1976), Carmichael *et al.* (1980) and Nagamani *et al.* (2006). Relevant literature has been consulted whenever necessary.

RESULTS AND DISCUSSION

Overall 390 diversified samples from Andhra Pradesh were screened in our laboratory comprising of 97 of cultivated, garden soil; 90 of forests, scrub jungle soils; 77 samples of mud, pond mud, river bank and seashore soils; 75 of barren soils; 28 of rhizosphere soils; 20 of polluted soils; two of herbicide treated soils and one of poultry farm soil (Table 1). Altogether 348 fungal species representing 132 genera were recorded (Table 1). Amongst all the fungi isolated, 2 belonged to Basidiomycotina, 17 belonged to zoosporic fungi (Mastigomycotina), 25 to Zygomycotina, 73 to Ascomycotina and the remaining 231 are grouped under anamorphic fungi (Deuteromycotina) which are the asexual phases of Ascomycotina and Basidiomycotina (Fig. 2). The number of microfungi recorded from various soil substrates are depicted in Fig. 3.

Amongst the various fungi *Aspergillus* and *Penicillium* species were predominant followed by *Chaitomium* and *Trichoderma*. Many soil-borne and root-borne pathogenic fungi like *Colletotrichum* spp., *Fusarium* spp., *Athelia rolfsii* (= *Sclerotium rolfsii*), *Gibberella* spp., *Macrophomina phaseolina*, *Nectria* spp. were also encountered. 18 species representing the genus *Trichoderma*, a well known biocontrol

Table 1. List of soil fungi from Andhra Pradesh

Sl. No.	Fungal species	Substance	Year and Place of Collection	Collected by	Accession No.
1.	<i>Absidia cylindrospora</i> Hagem	Soil	2011, Hyderabad	Kunwar	OUFH 830
2.	<i>Absidia fusca</i> Linnemann	Pond mud	1983, Hyderabad	Manohar.	OUFHS 1

347.	<i>Zygorhynchus moelleri</i> Vuill.	Cultivated soil	1979, Nanded	Manohar.	OUFHS 332
348.	<i>Zygosporium masonii</i> Hughes	Forest soil	2005, Vikarabad	Kunwar	OUFH 282

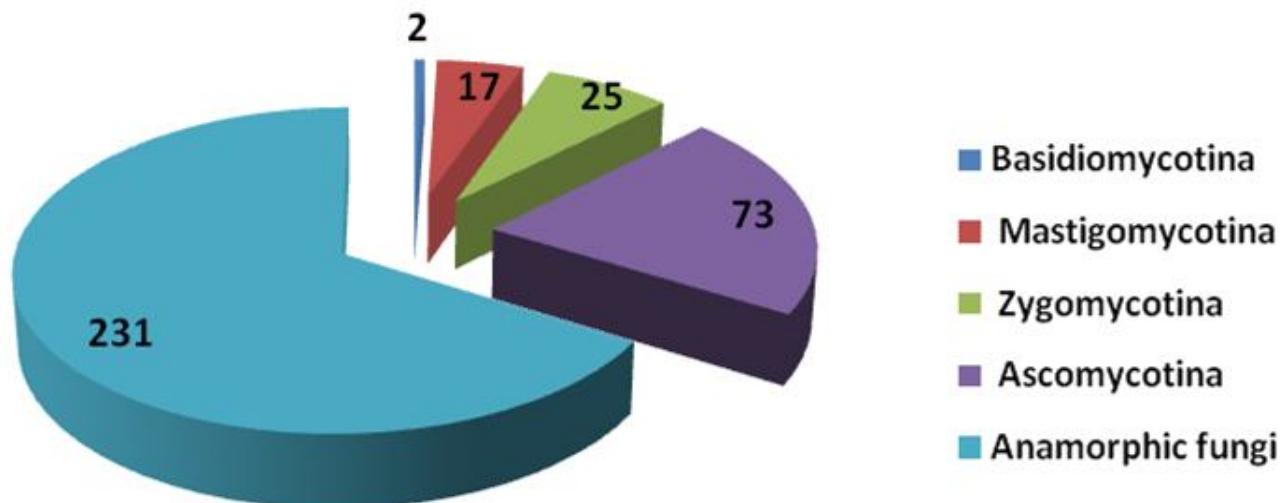

Figure 2. No. of fungi recorded from different fungal groups in Andhra Pradesh

agent were isolated. Several fungal species known for their industrial importance were also isolated.

We are grateful to the researchers and students (of

CM) for sample collection. CM is thankful to the National Academy of Sciences, India for encouragement and financial support.

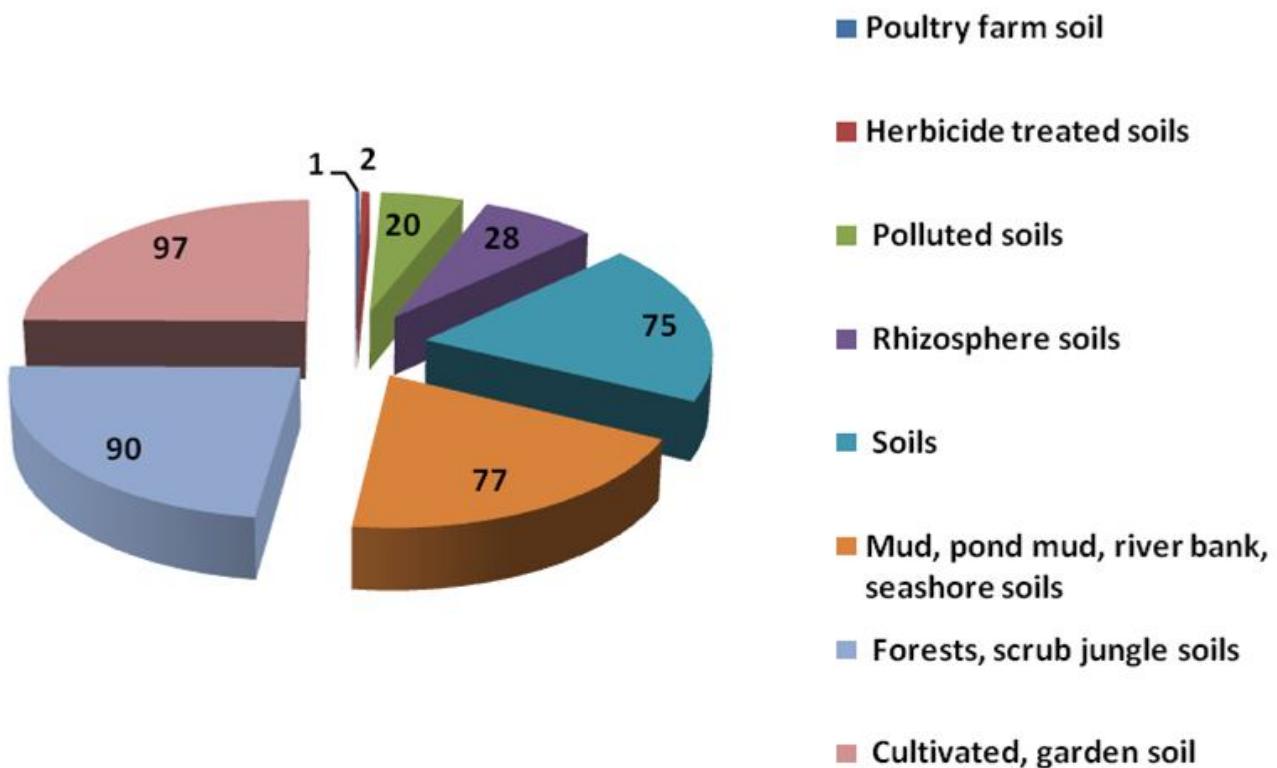

Figure 3. No of fungi recorded from various soil substrates of Andhra Pradesh
